

A PLAIN-LANGUAGE BRIEF · SEPTEMBER 2026

# Making XRP safer to hold, and easier to trust.

How NOSHASHI's new security tools and Customer Asset Protection help everyday holders, the businesses that serve them, and the XRP Ledger as a whole. Written for beginners and investors.

## 01 · THE SHORT VERSION

# The XRP Ledger works. People still lose money around it.

The XRP Ledger has been running since 2012, and money is rarely lost to a flaw in the ledger itself. It is lost **around** it: a stolen secret key, a fake website, a signature someone did not understand, a business that did not really hold its customers' XRP. Every one of those losses makes XRP harder to trust, for newcomers and for the banks and businesses that could bring the next wave of users.

NOSHASHI reads the public XRP Ledger and turns what it finds into plain answers. The new tools do three things:

| WHAT                         | IN PLAIN WORDS                                                                                                                           | WHO IT IS FOR                                         |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------|
| <b>Protect people</b>        | Spot a theft in progress, prepare an emergency escape plan, check a link or an address before trusting it.                               | Anyone who holds XRP. Free.                           |
| <b>Protect businesses</b>    | Check every outgoing payment before it is sent, share warnings about scam accounts, and watch token markets for manipulation.            | Exchanges, custodians, payment companies.             |
| <b>Prove it to customers</b> | Let a business show, from the ledger, that it really holds its customers' XRP, and let each customer check their own balance is counted. | Businesses holding customer XRP, and their customers. |

## THE ONE-SENTENCE SUMMARY

NOSHASHI makes the XRP Ledger's public record readable, so people can avoid the common traps and businesses can prove they are honest, and both of those make XRP easier to trust and to use.

## Two things NOSHASHI never does

- **It never holds your XRP or asks for your secret key.** It only reads the public ledger. When it suggests an action, it prepares an unsigned transaction that you review and sign in your own wallet.
- **It is not insurance.** Nobody pays claims and no government stands behind it. It shows you facts you can check for yourself.

## 02 · THE PROBLEM

# Five ways people lose XRP today, and what now helps

Payments on the XRP Ledger are final: once confirmed, no one can reverse them, not even the network. That is a strength for businesses, but it means mistakes and thefts stick. Here is what goes wrong most often.

| WHAT HAPPENS                                       | WHY IT HURTS                                                                 | WHAT NOSHASHI DOES                                                                                                                                     |
|----------------------------------------------------|------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>A secret key leaks</b>                          | Whoever has the key can empty the account, and it becomes a race.            | <b>Emergency kit:</b> the exact steps, in the right order, to move everything to safety and change the keys. It can be prepared and signed in advance. |
| <b>Signing something you did not understand</b>    | A fake site asks for one signature that hands over control of the account.   | <b>Pre-sign check:</b> explains any transaction before you sign it. <b>Drainer check:</b> spots the patterns thieves leave behind.                     |
| <b>A link in a tiny “gift” payment</b>             | Scammers send hundreds of tiny payments carrying links to fake wallet sites. | <b>Phishing link feed:</b> reads the ledger every minute and records every website advertised this way.                                                |
| <b>Sending to a lookalike address</b>              | A fake address that starts and ends like a real one is copied by mistake.    | <b>Withdrawal screening:</b> checks each outgoing payment against past destinations, sanctions lists and reported scams.                               |
| <b>A business that did not really hold the XRP</b> | Customers learn too late that the balances on their screen were not backed.  | <b>Customer Asset Protection:</b> proof, checked daily against the ledger, that the XRP is really there (next page).                                   |

## AND WHEN MONEY IS ALREADY GONE

No one can reverse a confirmed payment, and anyone offering to “recover” stolen crypto for a fee is usually running the second half of the scam. What does work: finding which exchange the money reached, so the victim can ask that exchange to freeze it quickly. NOSHASHI's **“Who is this?”** tool names the service behind an address when the ledger shows it, and says what to send them.

## 03 · CUSTOMER ASSET PROTECTION

# A receipt you can check, instead of a promise you have to trust

When you keep money in a bank, deposit insurance protects you up to a limit if the bank fails. When you keep XRP with an exchange or custodian, there is usually nothing like that, and you cannot see whether your XRP is actually there. Customer Asset Protection gives customers the next best thing: proof they can check themselves, every day, from the public ledger.

How it works, in three steps

- 1 **The business shows what it owes.** It adds up every customer balance into one sealed total, like putting every customer's receipt into a tamper-proof envelope. Only the total, the number of customers and a fingerprint of the envelope are published. No names, no individual balances.
- 2 **Each customer checks they are in the envelope.** Each customer gets a small proof that their own balance is inside. They check it on [noshashi.app/protection](https://noshashi.app/protection) in their own browser, without seeing anyone else's balance. If a business leaves someone out or shrinks a balance, that customer's proof stops working.
- 3 **NOSHASHI checks what it holds, every day.** The business names the XRP Ledger accounts that hold customer money. Every day NOSHASHI reads those accounts from the ledger and compares them with what is owed: fully backed, partly backed or under-backed. Each day's record is chained to the one before, so the history cannot be quietly rewritten.

## The optional safety fund

A business can also set XRP aside to make each customer whole up to a set amount if it fails, much as deposit insurance promises a fixed amount per depositor. NOSHASHI only counts that fund as real if **no single person can take it**: it must be locked on the ledger until a date, or need several people to sign before it moves. XRP that one key can move counts for nothing, and the page says so.

### WHAT IT IS NOT

It is **not insurance** and not a government guarantee. NOSHASHI pays no claims. It verifies and publishes what is on the ledger, so customers and investors can see the facts instead of taking anyone's word for them.

## 04 · WHY THIS MATTERS FOR XRP

# Trust is what turns a good network into a used one

XRP was designed for moving money between businesses, quickly and cheaply. The technology is ready. What holds adoption back is mostly trust: newcomers are afraid of being scammed, and regulated businesses need to show they are safe before they can use it. Tools like these address both.

| FOR                                  | WHAT CHANGES                                                                                      | WHY IT MATTERS FOR XRP                                                                                            |
|--------------------------------------|---------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Everyday holders</b>              | Free checks before sending or signing; a plan ready if something goes wrong.                      | Fewer painful first experiences means more people stay, and they tell others it was safe.                         |
| <b>Exchanges and custodians</b>      | Screening of every withdrawal and deposit; shared scam warnings; daily proof of reserves.         | Businesses can meet compliance expectations on the XRP Ledger itself, which makes offering XRP easier to justify. |
| <b>Customers of those businesses</b> | A page where they can check that their XRP is really held, and that their balance is counted.     | Collapses that hide missing funds become harder to hide, and that protects confidence in the whole market.        |
| <b>Token markets on the ledger</b>   | Surveillance that flags orders that are never meant to fill, and trades between related accounts. | Prices on the ledger's own exchange become easier to trust, which helps real traders and issuers.                 |

Seen on the real XRP Ledger while building this

|                                                                                                                                |                                                                                                                     |                                                                                                                          |
|--------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>99</b><br>accounts sprayed with a tiny "gift" payment by one scam relay, which then deleted itself and passed the money on. | <b>171</b><br>orders placed and replaced on one token in minutes by a single account. <b>None</b> were ever filled. | <b>3.3 billion</b><br>XRP locked in escrows in one of Ripple's wallets, itself controlled by a 4-of-8 multi-signer list. |
|--------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|

The same proof method was tested on a real token with 138 holders: the sealed total matched, to the last digit, the 33,733,671.32 units the ledger itself says the issuer owes. Numbers like these are indicators, not verdicts. An account re-placing orders can be an ordinary market maker, and the tools say so.

## 05 · WHO GETS WHAT

# Free for individuals. Deeper tools for businesses.

Everything a single person needs to stay safe is free. Paid plans add what businesses need to protect many customers at once.

| PLAN                 | PRICE                | HIGHLIGHTS                                                                                                     |
|----------------------|----------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Free</b>          | \$0                  | Emergency kit and drainer check, “Who is this?”, scam-registry and phishing-link lookups, pre-sign check.      |
| <b>Pro</b>           | \$749 / seat / month | Everything in Free, plus recovery and exposure scans across 25 addresses and scam-cluster mapping.             |
| <b>Institutional</b> | \$4,000 / month      | Proof of reserves with customer inclusion proofs, checked daily. Report scam addresses to the shared registry. |
| <b>Enterprise</b>    | \$10,000 / month     | A protection fund with a public page, screening of every withdrawal, and market surveillance.                  |
| <b>Strategic</b>     | \$20,850 / month     | Instant alerts if reserves fall short, and the phishing link feed as a data feed.                              |

## Words to know

| TERM                     | MEANING                                                                                            |
|--------------------------|----------------------------------------------------------------------------------------------------|
| <b>XRP Ledger</b>        | The public network where XRP moves. Anyone can read it, and confirmed payments cannot be reversed. |
| <b>Secret key (seed)</b> | The password that controls an account. Whoever has it controls the money. Never share it.          |
| <b>Signing</b>           | Approving a transaction with your key. Read what you sign: one signature can hand over an account. |
| <b>Proof of reserves</b> | Showing from the ledger that a business really holds the XRP it says it holds for customers.       |
| <b>Inclusion proof</b>   | Your personal check that your balance is counted in a business's published total.                  |
| <b>Escrow</b>            | XRP locked on the ledger until a set date. No one can move it early.                               |
| <b>Multi-signer list</b> | An account that needs several people to approve a payment, so no single person can take the money. |

**Important.** This brief explains what NOSHASHI's software does. It is not financial, investment or legal advice, and it makes no prediction about the price of XRP. NOSHASHI reads the public XRP Ledger and never holds funds or keys. Customer Asset Protection is verification, not insurance: NOSHASHI pays no claims and no government scheme stands behind it. Figures were read from XRP Ledger mainnet in September 2026. Learn more at [noshashi.app/learn](https://noshashi.app/learn).
