

NOSHASHI

MARKET INTELLIGENCE, REIMAGINED.

ANALYZE · DISCOVER · NAVIGATE

A zero-trust intelligence workstation for the XRP Ledger. It answers two questions about the same position, in the same second, from the same validated ledger state: am I allowed to move this, and could I actually get out of it?

INFRASTRUCTURE BRIEFING · XRPL MAINNET · NO TESTNET PATH EXISTS

An asset is two facts, not one

An issued balance on the XRP Ledger is only an asset if two things are true at once. The issuer cannot immobilise it — a compliance fact, sitting in account flags. And there is somewhere to sell it — a market fact, sitting in the DEX and the AMM pools.

Either one alone is a half-answer. A position with clean freeze rights and no order book is untradeable. A position with deep liquidity behind an issuer who can freeze it at will is not owned. Institutions carry both risks and currently measure neither, because the tooling is split between compliance vendors who never read the book and market terminals that never read the flags.

THE JOIN

NOSHASHI reads both over one socket, in the same second.

CAN THIS ISSUER FREEZE ME?	account flags · lsfGlobalFreeze, lsfNoFreeze
HOW MUCH OF MY BOOK IS IN IT?	Herfindahl-Hirschman Index
HOW DEEP IS THE EXIT?	book_offers · amm_info

No other tool on this chain reports the conjunction. That is the product.

Adjudication before signature

Compliance on XRPL today is a report written after the fact, so the first signal that a transaction was ineligible is that it failed. NOSHASHI runs the check before a transaction exists. Nothing here touches the ledger: the gate is built entirely from read operations, which is precisely why it can run before anything is signed.

01 · DESCRIBE

Name the settlement

Destination, amount, and the permissioned domain it is headed into. No signature, no broadcast, no fee at risk.

02 · ADJUDICATE

Evaluate the rule set

Credentials, reserve, ceiling and governance, in a fixed order. Deterministic — identical inputs always produce an identical verdict.

03 · RECEIPT

Hash the verdict

A canonical SHA-256 digest over the evaluation. Provable that the check ran; private about what was checked.

The verdict is GO, HOLD or NO-GO, returned with the exact rule that decided it. A blocking rule fails to NO-GO; an advisory rule fails to HOLD.

- **GO** Every configured rule passed.
- **HOLD** An advisory rule failed. A human decides.
- **NO-GO** A blocking rule failed. Settlement is refused.

Data, and its provenance

Every reading is traceable to a validated ledger and a named command. Where a module has no source in the build it is reported as NOT CONFIGURED rather than populated with a plausible number. This is load-bearing, not a caveat: NOSHASHI is sold on the claim that it does not fabricate, so an interface displaying a sentiment score it never measured would falsify the product on its first screen.

MODULE · SOURCE · STATUS

LEDGER STATE	wss://xrplcluster.com (+ s1/s2 failover)	LIVE
ACCOUNT & FLAGS	account_info · account_lines	LIVE
CREDENTIALS	XLS-70 objects · account_objects	LIVE
MARKET DATA	XRPL DEX · book_offers	LIVE
LIQUIDITY	XLS-30 AMM · amm_info	LIVE
ON-CHAIN SUPPLY	gateway_balances	LIVE
IDENTITY	Supabase — accounts only	LIVE
MACRO	no source in the build	NOT CONFIGURED
SENTIMENT	no source in the build	NOT CONFIGURED

Macro and sentiment require external feeds NOSHASHI does not ship. They appear in the interface with a place for the operator to add their own key, and are never rendered as live.

Exit liquidity

Freeze rights say whether an issuer may immobilise a balance. The order book says whether anybody would buy it if they didn't. Joining them produces a risk primitive nothing else on this chain reports — and the join is only possible because `amm_info` returns pool depth and `asset2_frozen` in the same response.

CLEAR	Liquid enough to exit, and nobody can stop you.
CONSTRAINED	An exit exists but it costs something, or somebody else controls it.
TRAPPED	No exit at a price the ledger can evidence.

MEASURING DEPTH HONESTLY

Naive depth is a fiction. Summing every resting offer counts bids at a thousandth of the market as though they were an exit. Two corrections were necessary, both found by probing mainnet rather than by reading code:

One — the touch is routinely poisoned. GateHub USD/XRP was observed with a best bid of 19.90 against a real market of 0.68: a single stale offer at 29x, setting the mid for everything downstream. The reference is now the tightest uncrossed pair, and a crossed book is disclosed rather than smoothed away.

Two — only depth within 10% of mid is reachable. Everything beyond it is a wish.

MEASURED · GATEHUB USD/XRP · XRPL MAINNET

	NAIVE	CORRECTED
SPREAD	-18,675 bps	20 bps
FULL-EXIT SLIPPAGE	9,340 bps	10 bps
USABLE BID DEPTH	12,692,991 USD	13,894 USD

The book advertised 12.7 million USD of depth. 13,894 is reachable — a 913x overstatement. For a product whose entire claim is whether you could actually get out, that is the difference between a position marked liquid and a position nobody would pay for.

What ships today

Everything below reads validated mainnet state. Nothing is estimated, simulated or backfilled.

COMPLIANCE

- Adjudication gate — GO / HOLD / NO-GO against XLS-80 domains
- Canonical SHA-256 receipt over every verdict
- XLS-70 credential registry with selective disclosure
- Issuer freeze rights — IsfGlobalFreeze, IsfNoFreeze, IsfRequireAuth
- Travel Rule (FATF R.16) scoping against a configurable threshold
- Counterparty concentration by Herfindahl-Hirschman Index
- Issuer drift monitor with native alerts on a flag transition
- Persistent adjudication ledger — 10,000 verdicts, on device
- Editable rule set — the operator states their own thresholds
- Signed audit export — chain-of-custody over the exact bytes
- Offline adjudication, stamped with ledger index and state age

MARKET INTELLIGENCE

- Order book depth — real bids and asks via book_offers
- AMM pool state — liquidity, trading fee and frozen status
- Issuer obligations — real circulating supply per currency
- Exit liquidity — freeze risk x concentration x realisable depth

PLATFORM

- macOS menu-bar HUD with a live ticker
- On-device compliance agent — any model, local defaults
- Binary integrity verification, free on every tier
- Accounts, 2FA and OTP, subscription billing, entitlement gating

Where this is going

THE GOAL

To make complex markets easier to understand through data, intelligence and design — and to be the trusted intelligence layer for the next financial frontier. Concretely for XRPL: that no institution has to choose between knowing whether a settlement is allowed and knowing whether it is exitable.

COMMERCIAL INITIATIVE

The entire console is free forever. Paid tiers begin where a desk needs something an individual does not.

OPERATOR	DESK	INSTITUTION
Free forever Individuals and single desks	\$749 per seat / month Trading desks and funds	\$4,000 per month Regulated venues and custodians

IN FLIGHT

Zero-knowledge predicate proofs

Prove one fact — accredited, over 18, not sanctioned — without disclosing the payload behind it.

Proof-of-check anchoring

Put the receipt digest on-ledger so a third party can verify a check happened without seeing what was checked.

Regulator read-only seats

An examiner's own view of the receipt lineage, without a copy of the data leaving the institution.

Compliance API and webhooks

One call between a venue's checkout and a violation.

What NOSHASHI is not

Stated plainly, because an interface that implies otherwise is a liability.

Not custody

It cannot hold, sign or move an asset. There is no signing path in the build.

Not advice

A GO verdict means the configured rules passed. It is not a representation that a transaction is lawful in any jurisdiction and it discharges no obligation owed to a regulator.

Not a price oracle

It reports the book as the ledger reports it. It does not forecast.

Not a trading terminal

There is no order entry.

No testnet

No testnet path exists in the build.

SECURITY POSTURE

MAINNET ONLY

No testnet path in the build.

ZERO EGRESS

The agent runs on your machine.

NO CUSTODY

It cannot hold or move an asset.

OS KEYCHAIN

Secrets held by the system.

ROW-LEVEL SECURITY

Every table scoped to its owner.

NO CARD DATA

Payments handled by Stripe.
